

MSc Pharmaceutical Technology and Medicines Control Programme Specification

Academic Year:	2021/2
Degree Awarding Body:	University of Bradford
Final and interim award(s):	[Framework for Higher Education Qualifications level 7] Master of Science Master of Arts Postgraduate Diploma Postgraduate Certificate
Programme duration:	1 year full-time
Date last confirmed and/or minor modification approved by Faculty Board	June 2021

Please note: This programme specification has been published in advance of the academic year to which it applies. Every effort has been made to ensure that the information is accurate at the time of publication, but changes may occur given the interval between publishing and commencement of teaching. Any change which impacts the terms and conditions of an applicant's offer will be communicated to them. Upon commencement of the programme, students will receive further detail about their course and any minor changes will be discussed and/or communicated at this point.

Introduction

This programme is designed to continue the University of Bradford's record of accomplishment of developing innovative curricula in line with the needs of world-wide industry. The pharmaceutical industry is growing at a considerable pace, globally, and due to changing business dynamics, innovative pharmaceutical processing technologies are gaining importance. The increasing significance of technologies for manufacturing advanced drug delivery systems and the need to comply with stringent regulatory requirements has raised demand for a workforce with specialist skills in the area of pharmaceutical technology.

The programme will enable students to gain a wide perspective of pharmaceutical sciences that covers pharmaceutical formulation development with foundation knowledge of processing technologies. This provides advanced theoretical knowledge and laboratory skills of the sciences related to a pharmaceutical sciences discipline with the focus on the

development and production of medicines. This leads to an emphasis in the programme on clinical trial processes and procedures needed for licensing and regulation.

Medicine control is a principal element of this programme. It encompasses drug regulations, drug licensing, managing drug supply, drug procurement, drug testing and safety. It will enable students to develop key knowledge of structured enforcement and inspection standards through the application of quality assurance. Students will learn the principles of quality assurance and regulatory systems for the production of high-quality medicines by the pharmaceutical industry. Students will also gain knowledge and skills related to pharmacovigilance, including the safe and proper use of medicines.

The interdisciplinary postgraduate programme in Pharmaceutical Technology and Medicines Control has been developed taking into consideration the requirements of the global pharmaceutical industry and the strong infrastructure and expertise available across the Faculties of Life Sciences and Engineering & Informatics.

The course structure is modular, and the programme is delivered over 52 weeks. The taught components are run over two semesters (January to May and September to January), with the research project taking place between May and August. This programme offers a flexible structure to allow both January and September intakes. It is delivered through a combination of lectures, practical, seminars, small-group tutorials, workshops and an individual research-based dissertation and project

This programme will be hosted by the School of Pharmacy and Medical Sciences which is situated on the main University campus. The programme is interdisciplinary in structure and will be supported by the University's Analytical Centre. The programme will provide students with an exposure to and understanding of pharmaceutical technologies, delivery systems, drug regulation and process analytics.

Programme Aims

The programme is intended to:

- Provide an opportunity to develop a comprehensive understanding and knowledge in the area of pharmaceutical formulation development and its underpinning science and processes.
- Develop an understanding of the application of analytical techniques in pharmaceutical formulation development.
- Provide an insight into regulatory requirements for licensing pharmaceuticals and application of Process Analytical Technologies (PAT) in process development and the manufacture of pharmaceuticals.
- Provide students with knowledge and understanding of quality assurance and managing drug supply which can support the availability of quality of medicines.
- Provide an opportunity to develop a conceptual understanding that enables the student to evaluate critically current research and, where appropriate, to propose new hypotheses.

- Develop transferable skills including scientific literature searching and evaluating, reporting and presenting scientific information.

Programme Learning Outcomes

To be eligible for the award of Postgraduate Certificate at FHEQ level 7, students will be able to:

1. deal with complex issues related to pharmaceutical formulation and processing technologies both systematically and creatively.
2. understand and evaluate the application of different processes and techniques in preformulation and formulation development.
3. evaluate the application of analytical techniques for the characterisation of the physico-chemical properties of drug substances.
4. assess and evaluate with critical awareness the principle of the pharmaceutical quality system, which ensures the availability of quality affordable medicines.
5. demonstrate a clear understanding of current regulatory procedures in the licensing of medicines, and regulatory issues with reference to case studies.
6. demonstrate the qualities and transferable skills required to exercise initiative and personal responsibility and decision making in complex and unpredictable situations.

Additionally, to be eligible for the award of Postgraduate Diploma at FHEQ level 7, students will be able to:

7. understand and evaluate the application of different techniques in process analytics.
8. critically evaluate scientific literature and communicate scientific information both in writing and orally.
9. demonstrate independent learning and the critical thinking ability required for continuing professional development.

Additionally, to be eligible for the award of Degree of Master at FHEQ level 7, students will be able to:

10. demonstrate originality in application of knowledge, together with practical understanding of research techniques in an area within the pharmaceutical sciences.
11. demonstrate self-direction and originality in implementing a research project; employ appropriate experimental approaches and report their findings in relation to current research knowledge and understanding.

Curriculum

FHEQ Level	Module Title	Type	Credits	Semester	Study Period (Sept start)	Study Period (Jan start)	Module Code
6	Fundamentals of Drug Delivery	Option	20	1	1	3	PHA6005-B
7	Science of Solid Dosage Forms & Advanced Pharmaceutical Technologies	Core	20	1	1	3	PHA7007-B
7	Solid Analysis	Option	20	1	1	3	CFS7026-B
7	Quality Assurance and Medicine Safety	Core	20	1	1	3	PHA7051-B
7	Critical Appraisal of a Current Topic in Pharmaceutical Sciences	Core	20	2	2	1	PHA7005-B
7	Process Analytical Technologies (PAT) & Quality by Design (QbD)	Core	20	2	2	1	PHA7050-B
7	Separation Science and Mass Spectrometry	Option	20	2	2	1	CFS7027-B
7	Imaging	Option	20	2	2	1	CFS7028-B
7	Management of Global Pharmaceutical Supply	Option	20	2	2	1	PHA7049-B
7	Research Project	Core	60	3	3	2	PHA7011-E

Students will be eligible to exit with the award of Postgraduate Certificate if they have successfully completed 60 credits and achieved the award learning outcomes (LO1-6).

Students will be eligible to exit with the award of Postgraduate Diploma if they have successfully completed at least 120 credits and achieved the award learning outcomes (LO 1-9).

Students will be eligible for the award of Degree of Master if they have successfully completed at least 180 credits and achieved the award learning outcomes (LO1-11).

Learning and Teaching Strategy

The teaching and learning strategy takes into consideration the programme and modules and the nature of the subject, with the expectation that the students will take responsibility for their learning as they develop their academic skills. A wide variety of teaching and learning methods are applied across modules to suit different students' learning styles and are designed to be appropriate to the learning outcomes of the individual modules. Modules are supported by the virtual learning environment, provided by the University.

The students will be offered extended induction workshops throughout the first semester, for the necessary support to help them to make a smooth transition into the Framework for Higher Education Qualifications (FHEQ) Level 7 in the United Kingdom. As part of these workshops, students will be exposed at an early stage of their studies to an enquiry-based group task. Also, they will be introduced to self-reflection for continuing professional development (CPD) and strategies for reflective practice and will select activities to reflect on what they have learnt and how it will influence them in future (For more details on these workshops and other support that is available for students, see programme handbook).

The range of teaching and learning methods used across modules will facilitate participatory learning. These methods include formal lectures, laboratory practical sessions, critical appraisal, coursework assignments, presentations and workshop sessions. Lectures, tutorials and seminars will identify and develop new subject-specific skills and systematic understanding, which the students will apply in their research project. In face-to-face sessions concepts, principles and theories will be introduced and explored in lectures and discussed in tutorials by working through examples, with lab sessions to enhance collaborative experiences where students work with each other and the tutor to complete the lab exercises. These skills will be further developed through workshop sessions where students get the opportunity to work in small groups and also to participate in a course-based journal club where a number of recent research articles are discussed and presented in teams of two. Self-directed research-based learning is also a key element of subject skills development.

Throughout the programme, we make use of case studies so that students can apply their theoretical understanding to real-world issues. They will be engaged on a range of realistic group tasks that provide a real environment in which team skills can be practised and developed. These tasks include real industrial case studies that require a practical solution applying scientific knowledge which are considered authentic, as they mimic the way problems are solved in real-world settings. Additionally, the tasks are designed around technical and scientific knowledge that researchers use in employment, for example running journal clubs, workshops and research talks.

In this programme, critical thinking and analytical skills are applied across all modules including the Critical Appraisal module and MSc dissertation projects. This will help the students to develop an independent enquiry, based on established research techniques, that critically evaluates and interprets advanced research and scholarships linked to the pharmaceutical sciences field and demonstrates conceptual understanding and originality that contributes to knowledge in the discipline.

Student choice is important in developing ownership of their learning and fostering deep learning. The structure of the programme offers them the opportunity to study more specialised topics selected from a range of options. Students may indicate their choice of study subject by the third week of the study period.

The methods implemented in developing the students' practical skills include demonstrations and practical sessions linked with the taught modules. Students will also design formulations, use analytical techniques, develop skills in using software applications and use control and measuring instruments under supervision during the initial phase of their research projects.

MSc students undertaking a dissertation are expected to independently design, conduct, and report on a research project under the supervision of a tutor. The dissertation is a key part of the course as it accounts for one-third of the programme credits. The dissertation element brings together the knowledge and skills learnt throughout the programme and gives students the opportunity to build on a topic of interest within the pharmaceutical sciences field. It also allows them to further enhance their critical evaluation skills of the recent research developments in the pharmaceutical sciences and the ability to synthesize and evaluate the literature. This further allows students to acquire specialised knowledge and high-level research skills.

We invite industrial speakers to this programme on a regular basis. They present seminars on the most pressing topics within drug development in the industry and real case studies on the challenges in the drug development of some of their products. The students will have the opportunity to present their dissertation projects to industrial scientists, which enables them to communicate their research to a wider audience including researchers from the University. Besides, there will be an opportunity to attend industrial visits.

Development of transferable skills should occur throughout the programme. It will occur through preparation and presentation of critiques, project reports, laboratory reports and seminars. Implementation of the research project will provide the students with an opportunity to learn about effective planning, time management, interpersonal skills and professional responsibility.

The teaching and learning methods implemented to engage students in developing their knowledge and understanding include formal lectures (including those visiting lectures from pharmaceutical companies), laboratory coursework, small group discussions, syndicate workshops, project work, directed learning and individual work.

Assessment Strategy

Modules are assessed by a variety of means including essays, exams, laboratory reports, presentations (oral and poster) including journal club presentations, written critical review, case study report and a dissertation. Formative feedback is provided on all modules, for instance, students receive written formative feedback on the first report in Fundamentals of Drug Delivery, and Science of Solid Dosage Form & Advanced Pharmaceutical Technologies modules. They also receive written formative feedback on a draft of the critical appraisal report and dissertation. The students will have the opportunity to deliver a formative presentation in Quality Assurance and Medicine Safety, and Process Analytical Technologies (PAT) & Quality by Design (QbD) modules. On the other hand, assessment deadlines for all modules are carefully planned to ensure a balanced and manageable workload throughout the semesters. Additionally, assessment deadlines are recorded in the programme handbook, which is released to students on the induction day.

The students will have some choice in their assessment methods. For example, they can select optional modules that apply different assessment methods. The students will also have the choice to present their dissertation work either as an oral or poster presentation. They will also be provided with the marking scheme for the report course work,

presentation and dissertation beforehand and they are encouraged to make themselves familiar with it before starting their assignments.

The various assessment methods across modules are designed to reflect the range of learning outcomes in the programme and to allow the students to demonstrate their knowledge and achievement:

The methods of assessment to assess the students' knowledge and understanding in LO1 to LO5 and LO7 will include written examination, critical review, case study report, evaluation of project reports, presentations including journal club presentation and experimental coursework.

The methods of assessment of the ability to evaluate critically current research and advanced scholarship in the discipline include presentation of a critique of published research articles and experimental coursework, and most importantly, the MSc dissertation (outcomes LO8 to 11).

The methods of assessment of practical skills include verbal or written feedback on laboratory work linked with the taught modules. The presentation and appropriate use, understanding and analysis of these methods will be assessed through the MSc dissertation.

The MSc project is assessed by dissertation and presentation (oral or poster) and allows students to demonstrate achievement of all learning outcomes, and more specifically, achievement of LO10-11 required for the MSc degree.

The methods of assessment of transferable skills (LO 6) are built into the structure of the examinations, case studies, and research or project work.

Assessment Regulations

This Programme conforms to the standard University Postgraduate Assessment Regulations which are available at <https://www.bradford.ac.uk/regulations>.

Admission Requirements

We take into consideration a number of factors when assessing your application. It's not just about your grades; we take the time to understand your personal circumstances and make decisions based on your potential to thrive at university and beyond.

Consideration of applications will be based on a combination of formal academic qualifications and other relevant experience. Applications are welcome from students with non-standard qualifications or mature students (those over 21 years of age on entry) with significant relevant experience.

The standard entry requirements for the programme are as follows:

As a general guideline, acceptance on the Masters programme requires a first degree at Honours or equivalent (2:2) in a relevant area such as Biological Sciences, Chemistry, Pharmacy, Pharmacology or Pharmaceutical Sciences.

Applicants whose native language is not English will also have to pass a test in English approved by the University. The International English Language Testing Service Test (IELTS) administered by the British Council is the test which is preferred by the University.

Applicants must achieve an Overall Band of at least 6.0, with at least 5.5 in each of the four sub-tests.

Testing facilities are available at most British Council overseas offices. When taking the test, applicants should ask for a copy of their Test Report Form to be sent to the University.

Further information can be found at: <https://www.bradford.ac.uk/international/your-application/english-language-requirements/>

Recognition of Prior Learning

If applicants have prior certificated learning or professional experience which may be equivalent to parts of this programme, the University has procedures to evaluate and recognise this learning in order to provide applicants with exemptions from specified modules or parts of the programme.

Minor Modification Schedule

Version Number	Brief description of Modification	Date of Approval (Faculty Board)
1	Updated for January start	December 2020
2	Specification reformatted and made accessible	February 2021
3	Annual update for 2021 Academic Year	August 2021
